Pre- Sowing Seed Treatment Improves Germination and Seedling Vigor in Pomegranate (*Punica granatum* L)

A study was conducted in the nursery under 60% shade net house on seed germination of two varieties of pomegranate (*Punica granatum* L). The experiment was carried out in cv. Ganesh during 2011 and in cv. Bhagwa during 2012 with thirteen treatments and four replications under CRD. Each replication was having 25 seeds. Before sowing, the seeds were soaked with water and potassium nitrate (0.5 and 1% solution) for 6, 12, 18 and 24 hours and control (without soaking) was also maintained separately. After soaking in their respective solution and duration, the seeds were sown in raised beds having mixture of soil and FYM in 2:1 ratio to observe germination. After one month of sowing, the seedlings were transferred in polythene bags filled with the mixture of soil and FYM in 2:1 ratio. Fifty polythene bags having single seedling in each bag were maintained for each treatment to collect the data on growth and root parameters.

In cv Ganesh, the study revealed that the germination started almost in all the treatments on 10th day after sowing except in control and where the seeds were soaked with 0.5% potassium nitrate solution (KNO_3) for 6 hours whereas maximum germination (81%) was recorded in the treatment where seeds were soaked with 1% potassium nitrate solution for 18 hours at the end of the experiment *i.e.* 29th day after sowing during April. At significance level it was equal to the treatment where seeds were soaked with 1% potassium nitrate solution for 12 hours (74%). Fastest germination rate (GR), *at par* peak value PV and high germination value (GV) was also recorded in the treatment where seeds were soaked with 1% potassium nitrate solution for 12 hours. However, mean daily germination (MDG) was observed maximum

in the treatment where seeds were soaked with 0.5% potassium nitrate solution for 24 hours. The other characters such as shoot length, shoot vigor index (SVI), number of leaves, length of main root, number of primary roots, longest primary root, fresh and dry weight of shoot and root and root to shoot ratio (on dry weight basis) were also recorded either *at par* or maximum/ higher in the same treatment *i.e.* soaking with 1% potassium nitrate solution for 12 hours. The results obtained from the study suggested that since the treatment soaking with 1% potassium nitrate solution for 12 hours shown its superiority therefore could be recommended for this variety to improve germination and vigor.

On the other hand in cv Bhagwa, the germination was started on 9th day and lasted till 30th day after sowing during April. In this variety the maximum germination (86%) was obtained where seeds were soaked with water for 6 hours. Interestingly, the other parameters such as GR, PV, GV, shoot length, number of leaves, SVI, length of primary roots, fresh and dry weight of shoot and root and root to shoot ratio were also observed more/ maximum in the above treatment. However; MDG, Length of main root and number of primary roots recorded maximum where the seeds were soaked with 0.5% potassium nitrate solution for 18 hours, 1% potassium nitrate solution for 6 hours and 12 hours, respectively. The study revealed that soaking with water for 6 hours was the best among all the treatments and thus suggested for adoption in cv Bhagwa as it was more effective, simple, time saving and no cost involvement.

The results obtained from both the experiments indicated that seeds of cultivar Ganesh performed well when they were kept 12 hours for soaking in 1% potassium nitrate solution. This indicate that this variety is having hard seed coat and requires chemical treatment as suggested for long duration to soften the seed coat for its germination whereas, cultivar Bhagwa performed well with water soaking that too only for 6 hours. This suggests that the variety is having soft seed coat in comparison to cv Ganesh, therefore, requires only water treatment for less duration for its germination.

The overall conclusion of the study is to improve the germination and vigor, the seeds of cv. Ganesh should be soaked for 12 hours in 1% potassium nitrate solution whereas the seeds of cv. Bhagwa should be soaked for 6 hours in water only prior to sowing.

INSTITUTE RESEARCH COUNCIL

Annual Institute Research Council (IRC) meeting was held on 9th - 10th and 13th July, 2012. All the Scientists of the Centre participated in the meeting and presented the progress and significant findings of their projects. New project proposals were also discussed during IRC.

TRAINING PROGRAMMES

- Four training programmes (16th -18th July;18th -20th July; 6th - 8th August & 8th – 10th August,2012) for grassroot level workers of Rastriya Jalagam Yojana Chirgaon, Maujanipur and Jhansi of district Jhansi on Planning and Execution of IWMP Watershed were organized. Total 184 participants attended these programmes.
- Three training programmes (6th -8th, 10th-12th and 24th-25th September, 2012) for grassroot level workers and farmers from Jalaun district on Planning and Execution of IWMP Watershed were organized. Total 69 participants attended these programmes. The training was sponsored by BSA, Rashtriya Jalagam Yojna, Jalaun.
